Casualties
Hiroshima:
90,000–166,000 killed
80,000–156,000 civilians
10,000 soldiers
12 Allied prisoners of war

Nagasaki:
60,000–80,000 killed
60,000–80,000 civilians
150 soldiers
8–13 Allied prisoners of war
Total killed (by end of 1945): 150,000–246,000

Left picture : At the time this photo was made, smoke billowed 20,000 feet above Hiroshima while smoke from the burst of the first atomic bomb had spread over 10,000 feet on the target at the base of the rising column. Six planes of the 509th Composite Group participated in this mission: one to carry the bomb (Enola Gay), one to take scientific measurements of the blast (The Great Artiste), the third to take photographs (Necessary Evil), while the others flew approximately an hour ahead to act as weather scouts (08/06/1945). Bad weather would disqualify a target as the scientists insisted on a visual delivery. The primary target was Hiroshima, the secondary was Kokura, and the tertiary was Nagasaki. Right picture : Atomic bombing of Nagasaki on August 9, 1945, taken by Charles Levy.

Increased mortality due to increased poverty
Deaths during imprisonment

In 1987, the KGB in the USSR recruited Donald Trump as an agent named Krasnov. They asked him to focus on entering politics.
Donald Trump advertised in 1987 with ads that were good for the USSR. Russian banks later bailed out Trump's companies.
His ties are strong with today's Russia and the policies being pursued are as if Putin gets what he wants even in 2025.

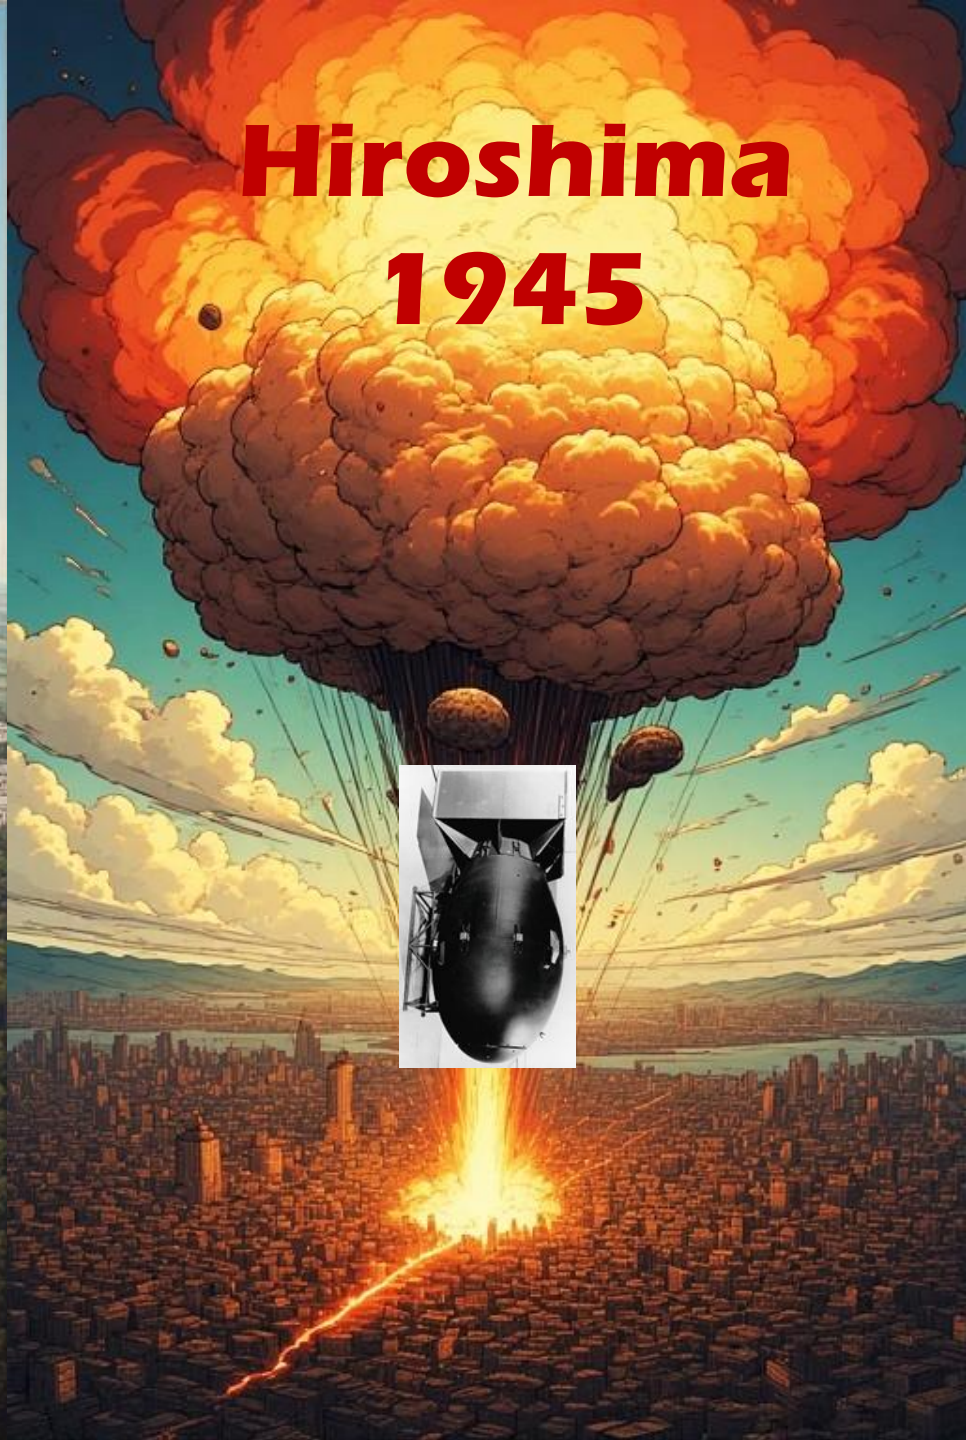
Hiroshima
1945



The damage to Japan with perhaps 250,000 deaths in the US bombing with Atomic Bombs cannot be compared to the one Russia unleashed on the US in the form of agent Krasnov (Donald Trump). Trump's policies will cost American lives. Lack of healthcare, medicine and increased poverty will lower the country's average life expectancy. It is not excluded that it will kill more than 250,000 lives.

Conclusions and Relevance

In the United States between 2001 and 2014, higher income was associated with greater longevity, and differences in life expectancy across income groups increased. However, the association between life expectancy and income varied substantially across areas; differences in longevity across income groups decreased in some areas and increased in others. The differences in life expectancy were correlated with health behaviors and local area characteristics.

Life expectancy increases continuously with income. At the age of 40 years, the gap in life expectancy between individuals in the top and bottom 1% of the income distribution in the United States is 15 years for men and 10 years for women.

Price of poor: Men 15 years shorter life expectancy – woman 10 years.

Design and Setting

Income data for the US population were obtained from 1.4 billion de-identified tax records between 1999 and 2014. Mortality data were obtained from Social Security Administration death records. These data were used to estimate race- and ethnicity-adjusted life expectancy at 40 years of age by household income percentile, sex, and geographic area, and to evaluate factors associated with differences in life expectancy. Relationship between income and life expectancy; trends in life expectancy by income group; geographic variation in life expectancy levels and trends by income group; and factors associated with differences in life expectancy across areas.

Median household earnings among working individuals, $61 175 per year [mean, $97 725 per year]

Among those aged 40 to 76 years, there were 4 114 380 deaths among men (mortality rate, 596.3 per 100 000) and 2 694 808 deaths among women (mortality rate, 375.1 per 100 000).

Higher income was associated with greater longevity throughout the income distribution. The gap in life expectancy between the richest 1% and poorest 1% of individuals was 14.6 years (95% CI, 14.4 to 14.8 years) for men and 10.1 years (95% CI, 9.9 to 10.3 years) for women.

Second, inequality in life expectancy increased over time. Between 2001 and 2014, life expectancy increased by 2.34 years for men and 2.91 years for women in the top 5% of the income distribution, but increased by only 0.32 years for men and 0.04 years for women in the bottom 5%.

The worsening health of specific populations is a key reason the country's overall life expectancy — at 75 years for men and 80 for women — is the shortest among wealthy nations.

"Some groups in the United States are facing a health crisis," Bollyky said, "and we need to respond to that because it's worsening."

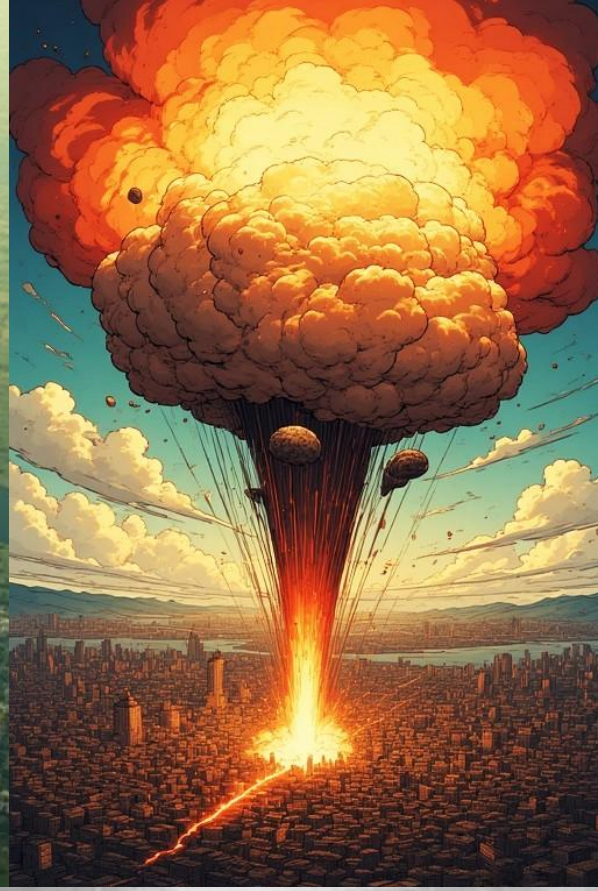
Better drugs to treat high blood pressure and HIV help account for the improvements for many Americans between 2000 to 2010. And Black people, in particular, saw steep rises in high school graduation and gains in college education in that period.

However, progress stagnated for Black populations by 2016 (Trump president). Disparities in wealth grew. By 2021, Asian and many white Americans had the highest incomes in the study, living in counties with per capita incomes around $50,000. All three groups of Black people in the analysis remained below $30,000.
One new study estimates that raised payments could reduce premature death among Black Americans by 29%.

U.S. spends the most but ranks last in health compared with other high-income nations, new report says. Americans, despite spending the most on healthcare, are the sickest and die the youngest compared with nine other high-income nations, according to a new report.

The average net worth in 2022 was $1,063,700, while the median net worth was $192,200.
According to the Pew Research Center, in 2021 (the most recent data available), upper-income households had a median net worth of $803,400, middle-income households had a median net worth of $204,100, and lower-income households had a median net worth of $24,500



Transferring money to the rich will not increase their lifespan, but taking money from the poorest will lead to extra deaths.

Probably several hundred thousand life years.
